During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone ame. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 9, constructed by the Sanger Centre Chromosome 9 Mapping
                                                                                                                                                                                                                                                                                                                                                                        AL807761 103861 bp DNA linear PRI 08-JAN-2003
Human DNA sequence from clone RP11-196118 on chromosome 9, complete
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Group. Further information can be found at http://www.sanger.ac.uk/HGPChr9 http://www.sanger.ac.uk/HGPChr9 for the from the library RPCI-11.1 constructed by the group of Pieter de Jong. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Center clone name: 196_I_18
Sequencing vector: M13, M77815, 100% of reads
Sequencing vector: M13, M77815, 100% of reads
Chemietry: Dye-terminator Big bye; 100% of reads
Assembly program: Phrap; version 0.960731
Consensus quality: 147250 bases at least Q40
Consensus quality: 142296 bases at least Q20
Consensus quality: 144570 bases at least Q20
Insert size: 157000; agarose-fp
Insert size: 145944; aum-of-contigs
Quality coverage: 4.1 in Q20 bases; sum-of-contigs

It currently consists of 26 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as arbitrary. On the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

granulocyte colony stimulating factor (G-CSF) expression for gene therapy and treatment of G-CSF associated disorders e.g. the side effects of Gene encoding an antigen recognizing an antibody which induces

Claim 1; Page 47-49; 58pp; Japanese.

The present invention relates to a gene encoding an antigenic protein recognised by an antibody or its fragments which can induce the production of granulocyte colony stimulating factor (G-CSF). Also included in the invention are partial sequences of the gene, antibodies recognising all or part of the antigenic protein, expression vectors containing the gene and host cells transformed by the vector. The gene used for gene therapy, and compounds identified by screening using the gene sequence are used for treatment and prevention of disorders associated with G-CSF expression such as the side effects of cancer

The irvention describes a cartilage cell differentiation stimulator (containing a membrane-bound transferrin-like protein (MTf-BP) and a membrane bound type transferrin-like protein (MTf-BP) and a concaravalin-like drug. The cartilage differentiation stimulator can be used in diagnosis, prevention and treatment of cartilage and bone metabolism diseases. They can also be used for diagnosing biophylaxis, cell differentiation, cell growth and construction of extracellular matrix related diseases. MTf-BP strongly stimulates differentiation of cartilage cells and exhibits similar action mechanism with that of plant derived ConA. This sequence represents a cartilage cell differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120

                                                                                               The invention relates to a mouse or human gene (MMR19) encoding a protein which binds to antibodies or their fragments which induce granulocytecolony stimulating factor (G-CSF) secretion. The genes and proteins of the invention are used in diagnosis, treatment and prevention of diseases associated with G-CSF, including infections and neutrophil deficiency disease. This sequence represents a cDNA encoding a mouse G-CSF-inducible antibody binding protein, MMR19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240

Also included in the invention are partial sequences of the gene, antibodies recognising all or part of the antigenic protein, expression vectors containing the gene and host cells transformed by the vector. The gene used for gene therapy, and compounds identified by screening using the gene sequence are used for treatment and prevention of disorders associated with G-CSF expression such as the side effects of cancer therapy (including bone marrow suppression). The present sequence

                        which binds to antibodies or their fragments which induce granulocyte-colony stimulating factor (G-GSF) secretion. The genes and proteins of the invention are used in diagnosis, treatment and prevention of diseases associated with G-GSF, including infections and neutrophil deficiency disease. This sequence represents a cDNA encoding a human G-GSF-inducible

This prepresents the micreotide bequence of inhal relacions and polymerication be micreotide bequence of inhalper production of the protein. HFIZG53 moleic acid are useful for diagnosing disease related to over or underexpression of HFIZG53 protein. The HFIZG53 polypeptides can be used to screen for agonists and antagonists which can be used in treatment to activate or inhibit HFIZG53 arctivity. Gene therapy may also be used to affect endogenous polypeptide production, using HFIZG53 polymolectides and retroviral vectors. HFIZG53 antibodies are useful for inducing an immune response to immunise and prevent diseases, and for isolating the prolypeptide by affinity chromatography. HFIZG53 polypeptides can be administered directly or as a vaccine to incoulate against disease. Diseases prevented, diagnosed or treated include inflammatory diseases much as Adult Respiratory Disease Syndrome, thematoid archritis, osteoarchritis, inflammatory Bowel Disease Syndrome, thematoid archritis, osteoarchritis, inflammatory Disease Syndrome, protozoan and viral, particularly HIV-1 and -2; HIV-associated cachexia and other immunodeficiency disorders; septic shock; injury; pain; cancers including testicular cancer; anorexia; bulimia; Parkinson's disease; cardiovascular disease including restences; septic shock; injury; pain; cancers including testicular cancer; anorexia; bulimia; Parkinson's disease; cardiovascular disease including restences; septic shock; injury; pain; cardioxers (cardiovascular disease including restences); anterosclerosis, acute heart cardiod, angina pectoris; ulcers; benign prostatic hypertrophy; and psychotic and neurological disorders (anxiety, schizophrenia, deliminal angina pectoris; urbaral mental relation) and dvakinesian manic depression, dementia, severe mental retardation) and dyskinesias, such as Huntington's diseases or Gilles de la Tourette's syndrome. The HFIZG53 polypeptide is also useful for mapping the gene to a chromosome This represents the nucleotide sequence of human HFIZG53. Host cells

The invention describes a cartilage cell differentiation stimulator (containing a membrane-bound transferrin-like protein (WTf-BP) and a membrane bound type transferrin-like protein (WTf-BP) and an animal-derived concanavalin-like drug. The cartilage differentiation at mimal-derived used in diagnosis, prevention and treatment of cartilage and bone metabolism diseases. They can also be used for diagnosing biophylaxis, cell differentiation, cell growth and construction of extracellular matrix related diseases. MTf-BP strongly stimulates differentiation of cartilage cells and exhibits similar action mechanism with that of plant derived ConA. This sequence represents a cartilage cell differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    7

The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises the preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatocoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.

diagnosing pre-pathologic disorders, and chronic or acute diseases associated with abnormalities in the expression, amount or distribution of the protein. The present sequence represents a cDNA of the invention that is differentially expressed in activated vascular tissue. Note: The sequence data for this patent did not form part of the specification, but was obtained in electronic format directly from USPTO at http.seqdata.uspto.gov/sequence.html?DocID=20020137081

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a combination comprising several CDNAs that are discloses a high throughput method for detecting differentially expressed in activated vascular tissue. The invention also discloses a high throughput method for detecting differentially expressed cDNAs in a sample. The CDNAs of the invention may have antiatreriosclerotic; cytostatic; cardiant; hypotenaive; antidiabetic; cytostatic; cardiant; hypotenaive; antidiabetic; cytostatic; cardiant; hypotenaive, antidiabetic; companies of secretive activities and may be used in gene therapy. The CDNAs of the invention may be used in a high-compound that specifically binds a CDNA of the invention. A protein encoded by the CDNA may be used to screen several contenties or compounds to identify a matibody to the protein that can be used to detect a protein in a sample or purify a natural or compounds to detect a protein in a sample or purify a natural or compounds to detect a protein in a sample or purify a natural or content that can be used to detect a protein in a sample or purify a natural or content of a vascullar disease, e.g. atherosclerosis, cancer, coronary artery disease, hypertensis, or stroke. The cDNAs can also be used for large-scale conjugated to genetic or gene expression analysis of several new nucleic acid contents or the protein contents of a vascullar disease. The cDNAs can also be used for large-scale conjugated to the protein conjugated by the CDNAs are useful for molecules. Antibodies to the proteins encoded by the cDNAs are useful for

The present invention describes a library of human polynucleotides comprising the sequences given in AZ12532 to AAZ1779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of polynucleotides sequences given in AAZ1232 to AAZ17779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polymucleotides may also be used to construct carrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to cancer). The polynucleotides of the invention are especially used in the cancer. The polynucleotides can also be used to screen for and lung cancer. The polynucleotides can also be used to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel human genes and their expression products which are differentially expressed in different cell types.

Novel human genes and their expression products which are differentially expressed in different cell types.

Claim 1; Page 2200; 2479pp; English

the present invention describes a filtrary of influent principled is comprising the sequences given in AZI2532 to AZI779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polymucleotide sequences given in AAZI3532 to AAZI779. The complaints are used for a variety of purpose, e.g. detection of expression levels, which can be used for a variety of purpose, e.g. detection of expression levels, can be used for a variety of purpose, e.g. detection of expression and detection of polymorphisms. Polymeptides encoded by the polymucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polymucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an cencoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to them produced by prognosis and management of colorectal cancer, breast cancer, nearly a general procession proprieted for management of colorectal cancer, breast cancer, nearly decrease and antibuted and proprieted and proprieted and produced and produced the polymucleotides can also be used to screen for particle and purpose and antibuted and antibuted and produced an The present invention describes a library of human polynucleotides peptide analogues and antagonists

The present invention describes a library of human polynucleotides comprising the sequences given in AAZ1233 to AAZ1779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in AAZ1233 to AAZ1779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polymucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polymucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to the cancer, The polymucleotides can are especially used in the diagnosis, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polymucleotides can also be used to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel human genes and their expression products which are differentially expressed in different cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               C, Pot D, Kassam A;

ABD17575 to ABD20506 represent isolated polynucleotide (I) sequences, and ABD5446 to ABD54472 represent protein (II) sequences, from the present invention. (I) and (II) have cytostatic activity and can be used in gene present and vand vaccines. (I), (II), antibodies and compositions from the present invention are useful for diagnosing, preventing and treating cancer, which expresses CT or CP mRNA antigens. They are useful for stimulating immune response. They can also be useful in virology, immunology microbiology, molecular biology and recombinant DNA techniques. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pot_sequences
